

AMENDMENTS TO THE CLAIMS

Kindly amend claims **37** and **45** as shown in the listing of claims below. This listing of claims will replace all prior versions, and listings of claims in the application.

LISTING OF CLAIMS

1 Claim 1. (previously presented) A two-dimensional scanner comprising:

- 2 a) a base;
- 3 b) an outer frame rotatably attached to the base for rotation about a first axis substantially
- 4 parallel to a plane containing the outer frame and/or the base;
- 5 c) an inner part rotatably attached to the outer frame for rotation about a second axis
- 6 substantially parallel to a plane containing the inner part and/or the outer frame;
- 7 d) a first set of comb fingers attached to the outer frame; and
- 8 e) a second set of comb fingers attached to the base, wherein the first and second sets of
- 9 comb fingers interdigitate in a substantially co-planar fashion at some rotation of the
- 10 outer frame relative to the base about the first axis.

1 Claim 2. (original) The scanner of claim 1, further comprising means for applying a voltage
2 between the first and second set of comb fingers, whereby the comb fingers may act as a
3 comb-drive actuator.

1 Claim 3. (original) The scanner of claim 2, further comprising means for applying a constant
2 biasing force between the outer frame and the base.

1 Claim 4. (original) The scanner of claim 2, further comprising means for sensing an angular
2 position of the outer frame relative to the base.

1 Claim 5 (original) The scanner of claim 4, wherein the means for sensing angular position are
2 chosen from the group consisting of gap-closing electrodes and piezoresistive sensors.

1 Claim 6. (original) The scanner of claim 4, wherein the means for sensing angular position
2 comprises a capacitance sensor electrically coupled between the first and second sets of
3 comb fingers, whereby the comb fingers may act as both a comb-drive actuator and a sensor.

1 Claim 7. (original) The scanner of claim 1, further comprising means for sensing an angular
2 position of the outer frame relative to the base.

1 Claim 8. (original) The scanner of claim 7, wherein the means for sensing angular position
2 includes a capacitance sensor electrically coupled between the first and second sets of comb
3 fingers.

1 Claim 9. (original) The scanner of claim 7, further comprising drive means for rotating the
2 outer frame relative to the base.

1 Claim 10. (original) The scanner of claim 9, wherein the drive means is chosen from the group
2 consisting of gap-closing electrodes, magnetic drives, and piezo drives.

1 Claim 11. (original) The scanner of claim 1, further comprising:
2 e) a third set of comb fingers attached to the inner part; and
3 f) a fourth set of comb fingers attached to the outer frame, wherein the third and fourth sets
4 of comb fingers interdigitate at some rotation of the inner part relative to the outer frame
5 about the second axis.

1 Claim 12. (original) The scanner of claim 11, further comprising:
2 g) means for applying a voltage between the first and second sets of comb fingers, whereby
3 the first and second sets of comb fingers may act as a comb-drive actuator; and
4 h) means for applying a voltage between the third and fourth sets of comb fingers, whereby
5 the third and fourth sets of comb fingers may act as a comb-drive actuator.

1 Claim 13. (original) The scanner of claim 12, further comprising:
2 g') means for measuring a capacitance between the first and second sets of comb fingers,
3 whereby the first and second sets of comb fingers may act as both a comb-drive actuator
4 and a position sensor; and

5 h') means for measuring a capacitance between the third and fourth sets of comb fingers,
6 whereby the third and fourth sets of comb fingers may act as both a comb-drive actuator
7 and a position sensor.

1 Claim 14. (original) The scanner of claim 12, further comprising:

2 g'') means for measuring a capacitance between the first and second sets of comb fingers,
3 whereby the first and second sets of comb fingers may act as a position sensor; and
4 h'') means for measuring a capacitance between the third and fourth sets of comb fingers,
5 whereby the third and fourth sets of comb fingers may act as a position sensor.

1 Claim 15. (original) The scanner of claim 14, further comprising drive means for rotating the
2 inner part relative to the outer frame.

1 Claim 16. (original) The scanner of claim 15, wherein the drive means is chosen from the
2 group consisting of gap-closing electrodes, magnetic drives, and piezo drives.

1 Claim 17. (original) The scanner of claim 14, further comprising drive means for rotating the
2 outer frame relative to the base.

1 Claim 18. (original) The scanner of claim 17, wherein the drive means is chosen from the
2 group consisting of gap-closing electrodes, magnetic drives, and piezo drives.

1 Claim 19. (original) The scanner of claim 1, wherein the outer frame is rotatably attached to
2 the base by means selected from the group consisting of torsional flexures, cantilever-like
3 flexures, serpentine flexures, and pin-and-staple type hinges.

1 Claim 20. (original) The scanner of claim 19, wherein the torsional flexures have cross-
2 sections selected from the group consisting of rectangular cross-section, I-shaped cross-
3 section, and T-shaped cross-section.

1 Claim 21. (original) The scanner of claim 1, wherein the inner part is rotatably attached to the
2 outer frame by means selected from the group consisting of torsional flexures, cantilever-like
3 flexures, serpentine flexures, and pin-and-staple type hinges.

1 Claim 22. (original) The scanner of claim 21, wherein the torsional flexures have cross-section
2 selected from the group consisting of rectangular cross-section, I-shaped cross-section, and
3 T-shaped cross-section.

1 Claim 23. (previously presented) A two-dimensional scanner comprising:

- 2 a) a base;
- 3 b) an outer frame rotatably attached to the base for rotation about a first axis substantially
4 parallel to a plane containing the outer frame and/or the base;
- 5 c) an inner part rotatably attached to the outer frame for rotation about a second axis
6 substantially parallel to a plane containing the outer frame and/or the base;
- 7 d) a first set of comb fingers attached to the inner part; and
- 8 e) a second set of comb fingers attached to the outer frame, wherein the first and second sets
9 of comb fingers interdigitate in a substantially co-planar fashion at some rotation of the
10 inner part relative to the outer frame about the second axis.

1 Claim 24. (original) The scanner of claim 23, further comprising means for applying a voltage
2 between the first and second set of comb fingers, whereby the comb fingers may act as a
3 comb-drive actuator.

1 Claim 25. (original) The scanner of claim 24, further comprising means for applying a constant
2 biasing force between the inner part and the outer frame.

1 Claim 26. (original) The scanner of claim 24, further comprising means for sensing an angular
2 position of the inner part relative to the outer frame.

1 Claim 27. (original) The scanner of claim 26, wherein the means for sensing angular position
2 are chosen from the group consisting of gap-closing electrodes and piezoresistive sensors.

1 Claim 28. (original) The scanner of claim 26, wherein the means for measuring angular
2 position comprises a capacitance sensor electrically coupled between the first and second
3 sets of comb fingers, whereby the comb fingers may act as both a comb-drive actuator
4 and a sensor.

1 Claim 29. (original) The scanner of claim 23, further comprising means for sensing an angular
2 position of the inner part relative to the outer frame.

1 Claim 30. (original) The scanner of claim 29, wherein the means for sensing angular position
2 includes a capacitance sensor electrically coupled between the first and second sets of
3 comb fingers.

1 Claim 31. (original) The scanner of claim 29, further comprising drive means for rotating the
2 outer frame relative to the base.

1 Claim 32. (original) The scanner of claim 31, wherein the drive means is chosen from the
2 group consisting of gap-closing electrodes, magnetic drives, and piezo drives.

1 Claim 33. (original) The scanner of claim 23, wherein the outer frame is rotatably attached to
2 the base by means selected from the group consisting of torsional flexures, cantilever-like
3 flexures, serpentine flexures, and pin-and-staple type hinges.

1 Claim 34. (original) The scanner of claim 33, wherein the torsional flexures have cross-
2 sections selected from the group consisting of rectangular cross-section, I-shaped cross-
3 section, and T-shaped cross-section.

1 Claim 35. (original) The scanner of claim 23, wherein the inner part is rotatably attached to the
2 outer frame by means selected from the group consisting of torsional flexures, cantilever-like
3 flexures, serpentine flexures, and pin-and-staple type hinges.

1 Claim 36. (original) The scanner of claim 35, wherein the torsional flexures have cross-section
2 selected from the group consisting of rectangular cross-section, I-shaped cross-section, and
3 T-shaped cross-section.

1 Claim 37. (currently amended) A fiber-optic switch comprising:
2 a) an array of input optical fibers;

- 3 b) one or more arrays of mirrors for deflecting light from one or more input optical fibers,
4 wherein one or more mirrors in the one or more arrays includes a two-dimensional
5 scanner; and
6 c) an array of output optical fibers for coupling light emerging from the one or more arrays
7 of mirrors;
8 wherein the two-dimensional scanner comprises:
9 i) a base;
10 ii) an outer frame rotatably attached to the base for rotation about a first axis
11 substantially parallel to a plane containing the outer frame and/or the base;
12 iii) an inner part rotatably attached to the outer frame for rotation about a second axis
13 substantially parallel to a plane containing the outer frame and/or the base;
14 iv) a first set of comb fingers attached to the outer frame; and
15 v) a second set of comb fingers attached to the base, wherein the first and second sets of
16 comb fingers interdigitate in a substantially co-planar fashion at some rotation of the
17 outer frame relative to the base about the first axis.

1 Claim 38. (original) The switch of claim 37, wherein the one or more arrays of mirrors
2 individually steer light from the input optical fibers to the output optical fibers.

1 Claim 39. (original) The switch of claim 37, wherein the input optical fibers and output optical
2 fibers are terminated with microlenses.

1 Claim 40. (original) The switch of claim 37, wherein the inner part includes a mirror.

1 Claim 41. (original) The switch of claim 37, further comprising means for applying a voltage
2 between the first and second set of comb fingers, whereby the first and second sets of comb
3 fingers may act as a comb-drive actuator.

1 Claim 42. (original) The switch of claim 37, further comprising means for sensing a
2 capacitance between the first and second comb fingers, whereby the first and second sets of
3 comb fingers may act as a position sensor for sensing an angular position of the outer frame
4 relative to the base.

1 Claim 43. (original) The switch of claim 42, further comprising means for applying a voltage
2 between the first and second set of comb fingers, whereby the first and second sets of comb
3 fingers may act as both a comb-drive actuator and an angular position sensor.

1 Claim 44 (original). The optical switch of claim 37, further comprising:

- 2 e) a third set of comb fingers attached to the inner part; and
- 3 f) a fourth set of comb fingers attached to the outer frame, wherein the third and fourth sets
4 of comb fingers interdigitate at some rotation of the inner part relative to the outer frame
5 about the second axis.

1 Claim 45. (currently amended) An optical switch, comprising:

- 2 a) an array of input optical fibers;
- 3 b) one or more arrays of mirrors for deflecting light from one or more input optical fibers,
4 wherein one or more mirrors in the one or more arrays includes a two-dimensional
5 scanner; and
- 6 c) an array of output optical fibers for coupling light emerging from the one or more arrays
7 of mirrors;

8 wherein the two-dimensional scanner comprises:

- 9 i) a base;
- 10 ii) an outer frame rotatably attached to the base for rotation about a first axis
11 substantially parallel to a plane containing the outer frame and/or the base;;
- 12 iii) an inner part rotatably attached to the outer frame for rotation about a second axis
13 substantially parallel to a plane containing the outer frame and/or the base;
- 14 iv) a first set of comb fingers attached to the inner part; and
- 15 v) a second set of comb fingers attached to outer frame, wherein the first and second sets
16 of comb fingers interdigitate in a substantially co-planar fashion at some rotation of
17 the inner part relative to the outer frame about the second axis.

1 Claim 46. (original) The switch of claim 45, wherein the one or more arrays of mirrors
2 individually steer light from the input optical fibers to the output optical fibers.

1 Claim 47. (original) The switch of claim 45, wherein the input optical fibers and output optical
2 fibers are terminated with microlenses.

1 Claim 48. (original) The switch of claim 45, wherein the inner part includes a mirror.

1 Claim 49. (original) The switch of claim 45, further comprising means for applying a voltage
2 between the first and second set of comb fingers, whereby the first and second sets of comb
3 fingers may act as a comb-drive actuator.

1 Claim 50. (original) The switch of claim 45, further comprising means for sensing a
2 capacitance between the first and second comb fingers, whereby the first and second sets of
3 comb fingers may act as a position sensor for sensing an angular position of the outer frame
4 relative to the base.

1 Claim 51. (original) The switch of claim 50, further comprising means for applying a voltage
2 between the first and second set of comb fingers, whereby the first and second sets of comb
3 fingers may act as both a comb-drive actuator and an angular position sensor.
